1. Precipitation that contains acids that formed in the atmosphere when emissions combined with water.
2. The gradual movement of continents by tectonic plates under Earth's surface which causes land masses to move toward or away from one another.
3. This process occurs when rock is exposed to water and air and is broken down or transformed into another material.
4. The breakdown of rock into smaller pieces by physical means. The forces that cause this are water, wind, ice, and gravity.
5. A process by which material is worn away from Earth's surface.
6. The layer of hot rock between Earth's crust and core.
7. The boundary between tectonic plates that are sliding past each other horizontally.
8. When plate boundaries move away from each other.
9. A cyclical pattern of movement in a fluid body, resulting from differences in temperature from one part to another
10. When sediments are carried by wind or water and are deposited in a new location.
